## Population Density

1. Nelson measures the acreage of the wildlife preserve at 325 acres. On the northeast side of the marsh, he counts 17 deer per square mile. What is the estimated number of deer on the preserve? There are 640 acres in a square mile.
2. Mercy counts the number of saltwater crocodiles, an endangered animal that is bred in pens. She has time to record the number of crocs in five pens. Estimate the number in all of the pens.

## Inbreeding Effective Size and Sex Ratio Correction

3. In the table, we can see the population of the lizards over a period of time. Calculate the Inbreeding Effective Size for the lizards using the population in the chart.

| Year | Population |
| :---: | :---: |
| 2007 | 210 |
| 2008 | 348 |
| 2009 | 205 |
| 2010 | 95 |
| 2011 | 250 |
| 2012 | 325 |

4. In the table, we can see the population of the snakes over a period of time. Calculate the Inbreeding Effective Size for the snakes using the population in the chart. Also, calculate the corrected population for 2006 to 2012

| Year | Adult <br> Population | Adult <br> Females | Adult <br> Males | Corrected <br> Population |
| :---: | :---: | :---: | :---: | :---: |
| 2006 | 152 | 95 | 57 |  |
| 2007 | 51 | 26 | 25 |  |
| 2008 | 45 | 23 | 22 |  |
| 2009 | 50 | 31 | 19 |  |
| 2010 | 48 | 32 | 16 |  |
| 2011 | 53 | 27 | 26 |  |
| 2012 | 44 | 26 | 18 |  |

## Logistic Growth Model

5. We will use a new formula called the Logistic Equation to look at populations in fixed areas. In our example, we acquire a tank that can hold 25,000 fish. We stock the tank with 5000 fish and we find the growth rate of our fish is around $2.5 \%$. Calculate the population for the fish for each year for 5 years.

$$
p_{N+1}=r \times\left(1-p_{N}\right) \times p_{N}
$$

where $r$ is the growth rate and $p_{N}$ is the decimal percent of the habitat's capacity

The first year calculation is: $P_{1}=2.5 \times(1-0.2) \times 0.2=0.4$

The second year calculation is: $P_{2}=2.5 \times(1-0.4) \times 0.4=0.6$

What happens in the third year? :

What happens in the fourth year? :

What happens in the fifth year? :

What is happening to the population?
6. In our next example, we again use a tank that can hold 25,000 fish. We stock the tank this time with 7000 fish and we find the growth rate of our fish is around $2.5 \%$. Calculate the population for the fish for each year for 5 years.

$$
p_{N+1}=r \times\left(1-p_{N}\right) \times p_{N}
$$

where $r$ is the growth rate and $p_{N}$ is the decimal percent of the habitat's capacity

The first year calculation is:

The second year calculation is:

The third year calculation is:

The fourth year calculation is:

The fifth year calculation is:

What is happening to the population?

## Population Growth

7. We estimate the rate of growth in the population of the gorilla to be $2.5 \%$. Using $N=N_{0} e^{r t}$ where the initial population is 550, what can we estimate the population to be in a dozen years if this group is protected? $\mathrm{e}=2.71828$
8. If we calculate the rate of growth formula using t equals $1 \div 12$, estimate how many new gorillas will join the group in a month? Why are using t equals $1 \div 12$ ?
9. Create a graph of the gorilla population at $10,20.30$ and 40 years

10. Today, the world's population is 7.052 billion. If the present rate of growth is $1.75 \%$ and is expected to maintain at that level, what will the estimated population be in thirty years?
11. Today, the world's population is just over 7 billion. Using the formula, $t=\frac{\ln \left(\frac{N}{N 0}\right)}{r}$ where N is the new population and $N_{0}$ is the original population. At the current growth rate of $1.75 \%$, what year will the world's population triple?

## Population Reduction

12. We estimate the rate of growth in the population of bison to be $-3.5 \%$. Using $N=N_{0} e^{r t}$ where the initial population in the area is 6530, what can we estimate the population to be in 5 years if this group is protected? $\mathrm{e}=2.71828$
13. Using the formula, $t=\frac{\ln \left(\frac{N}{N 0}\right)}{r}$ where N is the new population and $\mathrm{N}_{0}$ is the original population. At the present rate of decline, how many years will pass for the population to be cut in half?
14. Using the formula, $t=\frac{\ln \left(\frac{N}{N 0}\right)}{r}$ where N is the new population and $\mathrm{N}_{0}$ is the original population. At the present rate of decline, how many years will pass for the population to be cut in a quarter?
15. Using the formula, $t=\frac{\ln \left(\frac{N}{N 0}\right)}{r}$ where N is the new population and $\mathrm{N}_{0}$ is the original population. At the present rate of decline, how many years will pass for the population to be cut in a tenth?
16. Create a graph of the bison population based upon four calculations.

|  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
|  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
|  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
|  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
|  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
|  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
