|       |       |

1. Determine the drips per minute for the following patients weighing between 5 and 100 pounds. Find the patient's weight and go vertically to the sloped line representing the percent of dehydration. Each percent has 2 lines, one before 20 lbs and one after 20 lbs. Record the drips per minute from the horizontal line.

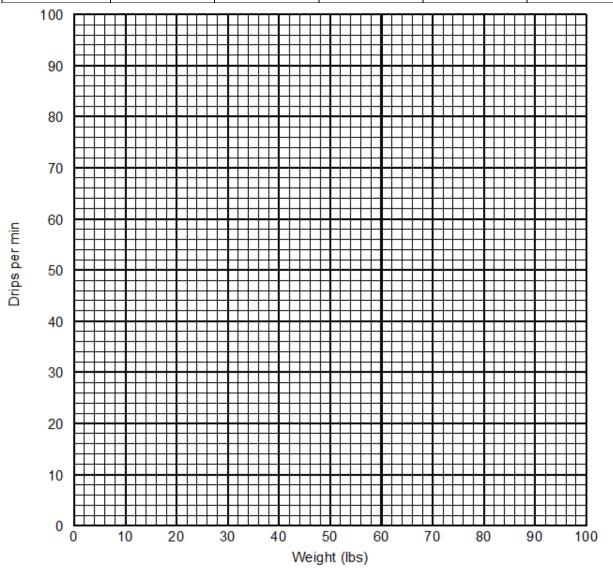

| Patient's Weight | % Dehydration | Drips per Minute |
|------------------|---------------|------------------|
| 11 lbs           | 1%            |                  |
| 19 lbs           | 1%            |                  |
| 73 lbs           | 1%            |                  |
| 13 lbs           | 7%            |                  |
| 31 lbs           | 7%            |                  |
| 91 lbs           | 7%            |                  |
| 9 lbs            | 15%           |                  |
| 51 lbs           | 15%           |                  |
| 85 lbs           | 15%           |                  |

3. Calculate the following for \_\_\_\_\_ percent dehydration (1 thru 17) and plot four points for the patient's weight and drips per minute on the chart by drawing two sloped lines between the points.

| Patient<br>weight | Replacement<br>Volume | Maintenance<br>Volume | Total<br>Volume | Milliliter per<br>Minute | Drips per<br>Minute |
|-------------------|-----------------------|-----------------------|-----------------|--------------------------|---------------------|
| 5 lbs             |                       |                       |                 |                          |                     |
| 20 lbs            |                       |                       |                 |                          |                     |
| 25 lbs            |                       |                       |                 |                          |                     |
| 100 lbs           |                       |                       |                 |                          |                     |

4. Determine the drips per minute for the following patients weighing between 5 and 100 pounds. Find the patient's weight and go vertically to the sloped line representing the percent of dehydration. Record the drips per minute from the horizontal line.

| Patient's Weight | % Dehydration | Drips per Minute |
|------------------|---------------|------------------|
| 15 lbs           |               |                  |
| 35 lbs           |               |                  |
| 75 lbs           |               |                  |
